comprises administering and second or new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, concenting or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing increasing renal plasma flow and glomerular filtration rate, treating precedures increasing reclampsia of pregnancy, and increasing a condition/
colampsia or eclampsia of pregnancy, and increasing a condition/
disorder that can be alleviated by increasing cardiac contractility
(congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                      Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; duturesis; renal plasma flow; glomentlar filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAY31535 Length: 35 February 4, 2005 13:19 Type: P Check: 7014 Found using 'seq4' (mohamed337.key)

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (tranal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing confirming renal plasma flow and glomerular filtration rate, treating precedure that can be alleviated by increasing a condition/ disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are increose a prolonged ware allow administered intravenously. Sequences AAY11505-560 represent examples of exendin agonists compounds
                                   Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diutesis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Type: P Check: 5178
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Prickett K;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       to: 34

Exendin agonist peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAY31539;
 HXXXXXX
                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GiP-1 (glucagon-like peptide) or GiP-1 agonist. The new methods using an exendin, exendin agonist, GiP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diluresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/eclampsia or eclampsia of pregnancy, and increasing a condition/econgestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics the new methods increase urine
                     Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregenancy; cardiac contractility; renal failure; diuretic; conqestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis; hypertension; urine flow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences
                                                                                                                                                                                                                                                                                                                                                                           Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAY31537 Length: 34 February 4, 2005 13:19 Type: P Check: 4739 Found using 'seq4' (mohamed337.key)

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GIP-1 (glucagon-like peptide) or GIP-1 agonist. The new methods using an exendin, exendin agonist, GIP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diluresis, preparing an individual for surgical procedure, treating increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing actiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine
Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis; hypertension; urine flow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAY31538 Length: 33 February 4, 2005 13:19 Type: P Check: 2764 Found using 'seq4' (mohamed337.key)

Exendin agonist peptide.
                                                                                                                                                                                                                                19-AUG-1999.
                                                                                                      Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAY31541;
 comprises administering an exemcian or exemcian agonist, or a GLD-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing unit of GLD-1 agonist are useful for increasing unit of GLD-1 agonist are useful for preventing a disorder associated with toxic hypervolemia (renal fallure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or celampsia of pregrancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sedium excretion without increasing location and are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         excretion and sodium excretion without increasing potassium loss, and are fast cathon. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AAY11505-560 represent examples of exendin agonists compounds

```
The invention relates to new methods of increasing urine flow that

comprises administering an exendin or exendin agonist, or a GLP-1

(glucagon-like peptide) or GLP-1 agonist. The new methods using an

exendin, exendin agonist, GLP-1 agonist. The new methods using an

candin, exendin agonist, GLP-1 agonist are useful for

increasing urine flow, decreasing potassium concentration in urine,

preventing or alleviating ad isorder associated with toxic hypervolemia

(renal failure, congestive heart failure, nephrotic syndrome, pulmonary

edema, cirrhosis, or hypertension). They can also be used for inducing

capid diureais, preparing an individual for surgical procedure,

increasing renal plasma flow and glomerular filtration rate, treating pre-

clampsia or eclampsia of pregnancy, and increasing a condition/

increasing renal balaviated by increasing cardiac contractility

(congestive heart failure, pulmonary dema, systemic edema or renal

failure). Unlike prior art diuretics, the new methods increase urine

excretion and sodium excretion without increasing potassium loss, and

fast acting. They have a prolonged duration of action, are inotropic,

have a low toxicity, and are easily administered intravenously. Sequences

AY31505-560 represent examples of exendin agonists compounds
Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      4, 2005 13:19 Type: P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Prickett K;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          to: 32

Exendin agonist peptide.
 SAXXEX
                                                                                                                                                                                                                                                                                                                                                                                                                                                 comprises administering an exendin or exendin agonist, or a GIP-1 comprises administering an exendin or exendin agonist, or a GIP-1 donist. The new methods using an exendin exendin exendin gonist. GIP-1 or GIP-1 agonist are useful for increasing urine flow, decreasing ptdrashium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing accontractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, and are ally administered intravenously. Sequences

comprises administering an exendin or exentin agonist, or a Gibble comprises administering an exendin or exentin agonist, or a Gibble comprises administering an exendin or exendin agonist. The new methods using an exendin, exendin agonist, Gibble agonist. The new methods using an increasing urine flow, decreasing potessium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, columpsia or colampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast They have a prolonged duration of action, are increptic, have a low toxicity, and are easily administered intravenously. Sequences AAY31805-560 represent examples of exendin agonists compounds
                                                                                                                     congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;
Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to new methods of increasing urine flow that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAV31542 Length: 31 February 4, 2005 13:19 Type: P Check: 7369 Found using 'seq4' (mohamed337.key)

                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to new methods of increasing urine flow that

comprises administering an exendin or exendin agonist, or a GLP-1

(glucagon-like peptide) or GLP-1 agonist. The new methods using an

exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for

increasing urine flow, decreasing potassium concentration in urine,

preventing or allevitating a disorder associated with toxic hypervolemia

(renal failure, congestive heart failure, nephrotic syndrome, pulmonary

edema, cirrhosis, or hypertension). They can also be used for inducing

capid diuresis, preparing an individual for surgical procedure,

increasing renal plasma flow and glomerular filtration rate, treating pre-

colampsia or calampsia of pregnancy, and increasing a condition/

disorder that can be alleviated by increasing cardiac contractility

congestive heart failure, pulmonary edema, systemic edema or renal

failure). Unlike prior art diureicis, the new methods increase urine

excrection and sodium excretion without increasing potassium loss, and are

excrection and sodium excretion without increasing potassium loss, and are

fast acting. They have a prolonged duration of action, are inotropic,

have a low toxicity, and are easily administered intravenously. Sequences

The invention relates to new methods of increasing urine flow that comprises administering an exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for exendin, examing or alleviating a disorder associated with toxic hypervolemia (consersing or inversing a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing capid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating preclampsia or eclampsia of pregnancy, and increasing a condition/ cisorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary dema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inctropic, have a low toxicity, and are easily administered incravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac confestility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Increasing urine flow by administering peptides or peptide agonists.

Exendin agonist peptide.
 EXXXEX
                                                                                                                                                                                                                                                                                                                                                                                                                                                        comprises administering an exembin or exemplin agonist, or a Gib-la comprises administering an exembin or exemplin agonist, or a Gib-la comprises administering an exembin or Gib-la agonist. The new methods using an exembin, exemplin by decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, proventing or alleviating a disorder associated with toxic hypervolemia capital diuresis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, concreasing renal plasma flow and glomenular filtration rate, treating precelampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are eaching. They have a prolonged duration of action, are inotropic, have a low toxicity, and are eachly administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                       Exendin, agonist, GLP-1; glucagon-like peptide, toxic hypervolemia, diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                             Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to new methods of increasing urine flow that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAY31545 Length: 29 February 4, 2005 13:19 Type: P Check: 2759 ound using 'seq4' (mohamed337.key)

The invention traders to new merinous or accompaniet, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin agonist, exendin, exendin agonist, GLP-1 agonist. The new methods using an exendin agonist, GLP-1 agonist. The new methods using an exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing optassium concentration in utine, preventing or alleviating a disorder associated with toxic hypervolemia (frend in it increasing or alleviating a disorder associated with toxic hypervolemia or expid diuresis, preparing an individual for surgical procedure, increasing rend plasma flow and glomerular filtration rate, treating precedianges or eclampsia of pregnancy, and increasing a condition/ disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are extracting the carrier and are easily administered intravenously. Sequences AAY11505-560 represent examples of exendin agonists compounds
Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diucesis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac corractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to new methods of increasing urine flow that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Type: P Check: 2320
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Prickett K;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               to: 38

comprises administering an exendin or exendin agonist, or a Gib-1 comprises administering an exendin or exendin agonist, or a Gib-1 comprises administering an exendin or exendin agonist. The new methods using an increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, purventing or alleviating a disorder associated with toxic hypervolemia capital disorder, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomenular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                  Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; dutuesis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to new methods of increasing urine flow that

                    AAY31548;
```

Structure in the property of the control of the con excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inciropic, have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds

Sequence 38 AA;

                                                                                                                       comprises administering an exemble of according agonist, or a Gib-1 comprises administering an exemble of Gib-1 agonist. The new methods using an exemple of Gib-1 agonist. The new methods using an exemple of Gib-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They consider procedure, increasing renal plasma flow and glomerular filtration rate, treating precelampsia or eclampsia of pregnancy, and increasing a condition/ disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, and the fact and processing processes and are fast acting. They have a prolonged duration of action, are inotropic, and the fact acting and initate expect intravenously, Sequences and the fact and acting a confidences.

comprises administering an exemdin or exemdin agonist. Or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin agonist, GLP-1 agonist. The new methods using an exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potessium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing campid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating precedures that can be alleviated by increasing cardiac condition/ disorder that can be alleviated by increasing cardiac condition/ congestive heart failure, pulmonary dema, systemic edema or renal failure, pulmonary dema, systemic edema or renal callure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are increosed are alow toxicity, and are easily administered intravenously. Sequences AAY11505-560 represent examples of exendin agonists compounds
                                                                                                                                Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to new methods of increasing urine flow that

Increasing urine flow by administering peptides or peptide agonists.

Example 50; Page 56; 94pp; English.

comprises administering an exendin or exendin agonist, or a GLP-1 comprises administering an exendin or exendin agonist. The new methods using an exendin, exendin agonist. GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/ disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodum excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences The invention relates to new methods of increasing urine flow that AAY31505-560 represent examples of exendin agonists compounds

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-1ike peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist. GLP-1 agonist are useful for exendin, exending adonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, or increasing urine flow, decreasing potassium concentration in urine, concerning or alleviating a disorder associated with toxic hypervolemia (crenal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary dema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; dirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Increasing urine flow by administering peptides or peptide agonists.

                                                                                                                                                                                                                                                                                                                                   8XXXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing poteasium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-clampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal (failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing poteasium loss, and are fast acting. They have a prolonged duration of action, are inotropic,
                                                                                                                                                                                                                                                                                                                                                                                                                                               Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; dutuesis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiactististy; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Increasing urine flow by administering peptides or peptide agonists.

comparises administering an exemdin or exendin agonist, or a GLP-1 comparises administering an exemdin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (frenal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular failure rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/ disorder that can be alleviated by increasing cardiac contractility congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are excretion and sodium excretion without increasing net inotropic, fast acting. They have a prolonged duration of action, are inotropic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; conqestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis; hypertension; urine flow.
have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to new methods of increasing urine flow that

Increasing urine flow by administering peptides or peptide agonists.

Example 56; Page 59; 94pp; English.

comprises administrating an exendin or exendin agonist, or a GLP-1 comprises administrating an exendin or exendin agonist. The new methods using an exendin, exendin exendin or GLP-1 agonist. The new methods using an glucagon-like peptide) or GLP-1 agonist. The new methods using an increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-clampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, The invention relates to new methods of increasing urine flow that

The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis; hypertension; urine flow.
have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to new methods of increasing urine flow that

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pullmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condittion/disorder that can be alleviated by increasing cardiac contractility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampaia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;
excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                          Check: 211

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre
(congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing poteasium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravencusly. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Exendin, agonist; GLP-1, glucagon-like peptide, toxic hypervolemia, diuresis, renal plasma flow, glomerular filtration rate, pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Increasing urine flow by administering peptides or peptide agonists.

```
The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre
-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are increopic, have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Exendin, agonist, GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomernlar filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                   Check: 1045

-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravenously. Sequences AAX31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diuresis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis; hypertension; urine flow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparting an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Increasing urine flow by administering peptides or peptide agonists.
                                                                                                                                                                                                                 Type: P Check: 237

-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are increopic, have a low toxicity, and are easily administered intravenously. Sequences AAY31505-560 represent examples of exendin agonists compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Exendin; agonist; GLP-1; glucagon-like peptide; toxic hypervolemia; diutesis; renal plasma flow; glomerular filtration rate; pre-eclampsia; eclampsia of pregnancy; cardiac contractility; renal failure; diuretic; congestive heart failure; nephrotic syndrome; pulmonary edema; cirrhosis;

Fri

rapid diuresis, preparing an individual for surgical procedure, increasing renal plasma flow and glomerular filtration rate, treating pre-eclampsia or eclampsia of pregnancy, and increasing a condition/disorder that can be alleviated by increasing cardiac contractility (congestive heart failure, pulmonary edema, systemic edema or renal failure). Unlike prior art diuretics, the new methods increase urine excretion and sodium excretion without increasing potassium loss, and are fast acting. They have a prolonged duration of action, are inotropic, have a low toxicity, and are easily administered intravencesty. Sequences AXX31505-560 represent examples of exendin agonists compounds

This sequence represents an exendin peptide, and is a GLP-1 agonist. The invention relates to the use of a glucagon like peptide-1 (GLP-1), its analogue, derivative, or a GLP-1 agonist for the preparation of a medicament for delaying the progression of impaired glucose tolerance (IGT) or non-insulin requiring type II diabetes to insulin requiring type II diabetes. The invention also relates to the use of GLP-1, its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Use of GLP-1, its analogs, derivatives and agonists for increasing insulin synthesis, delaying progression of impaired glucose tolerance or non-insulin requiring type II diabetes to insulin requiring type II
                                                                                                                                                                                                                                            Exendin, GLP-1; agonist; glucagon like peptide-1; insulin synthesis; impaired glucose tolerance; IGT; non-insulin requiring type II diabetes; insulin requiring type II diabetes.

The invention relates to new methods of increasing urine flow that comprises administering an exendin or exendin agonist, or a GLP-1 (glucagon-like peptide) or GLP-1 agonist. The new methods using an exendin, exendin agonist, GLP-1 or GLP-1 agonist are useful for increasing urine flow, decreasing potassium concentration in urine, preventing or alleviating a disorder associated with toxic hypervolemia (renal failure, congestive heart failure, nephrotic syndrome, pulmonary edema, cirrhosis, or hypertension). They can also be used for inducing

Increasing urine flow by administering peptides or peptide agonists.

```
This sequence represents an extendin-4 active fragment peptide sequence. Extendin-4 is a peptide produced in the salivary gland of the Gila Monster lizard. Extendin-4 has been shown to promote insulin secretion, and given in equimolar quantities, is more potent than glucagon-like protein-1 (GLP-1) at causing insulin release from insulin producing cells. GLP-1 is a hormone normally secreted by neuroendocrine cells of the gut, in response to food. GLP-1 fragments or Extendin-4 growth factor fragments can be used in the production of a population of insulinproducing cells from a population of non-insulin producing cells. The methods may also be used to promote pancreatic amylase producing cells to produce both insulin and amylase. The methods are used to treat diabetes mellitus (type 1) in humans, domesticated animals, livestock and pets
analogues, derivatives and agonists for increasing the insulin synthesis capability of a subject. The GLP-1 derivative is Arg34,Lys26(N-epsilon-(gamma-Glu(N-alpha-hexadecanoy1))-GLP-1(7-37). The GLP-1 agonist is particularly GLP-1(7-37) and GLP-1(7-36)amide and the corresponding Thr8, Met8, Gly8 and val8 analogues. The method is used for delaying progression of impaired glucose tolerance or non-insulin requiring type II diabetes and for increasing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Differentiation of non-insulin producing cells into insulin-producing cells by glucagon-like peptide-1 or extendin-4, used to treat diabetes

Sequence 39 AA;

```
This sequence represents an extendin-4 active fragment peptide sequence. Extendin-4 is a peptide produced in the salivary gland of the Gila Monster lizard. Extendin-4 has been shown to promote insulin secretion, and given in equimolar quantities, is more potent than glucagon-like protein-1 (GLP-1) at causing insulin release from insulin producing cells. GLP-1 is a hormone normally secreted by neuroendocrine cells of the gut, in response to food GLP-1 fragments or Extendin-4 growth factor fragments can be used in the production of a population of insulin-producing cells from a population of non-insulin producing cells. The methods may also be used to promote pancreatic amylase producing cells to produce both insulin and amylase. The methods are used to treat diabetes mellitus (type 1) in humans, domesticated animals, livestock and pets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Differentiation of non-insulin producing cells into insulin-producing cells by glucagon-like peptide-1 or extendin-4, used to treat diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                           Extendin-4; Gila Monster lizard; insulin producing cell; insulin; amylase; diabetes mellitus type 1; human; livestock; pet.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Type: P Check: 6333
                                                                                                      aay78958 ; Extendin-4 (1-38) active fragment amino acid sequence.

Extendin-4 is a peptide produced in the salivary gland of the Gila Monster lizard. Extendin-4 has been shown to promote insulin secretion, and given in equimolar quantities, is more potent than glucagon-like protein-1 (GLP-1) at causing insulin release from insulin producing cells. GLP-1 is a hormone normally secreted by neuroendocrine cells of the gut, in response to food. GLP-1 fragments or Extendin-4 growth factor fragments can be used in the production of a population of insulin-producing cells from a population of non-insulin producing cells. The methods may also be used to promete pancreatic amylase producing cells to produce both insulin and amylase. The methods are used to treat diabetes mellitus (type 1) in humans, domesticated animals, livestock and pets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sequence represents an extendin-4 active fragment peptide sequence.

                                                                                                                                                                                                                                                                  Egan J,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 match
    This sequence represents an extendin-4 active fragment peptide sequence. Extendin-4 is a peptide produced in the salivary gland of the Gila Monster lizard. Extendin-4 has been shown to promote insulin secretion, and given in equimolar quantities, is more potent than glucagon-like protein-1 (GLP-1) at causing insulin release from insulin producing cells. GLP-1 is a hormone normally secreted by neuroendocrine cells of the gut, in response to food. GLP-1 fragments or Extendin-4 growth factor fragments can be used in the production of a population of insulinproducing cells from a population of non-insulin producing cells. The methods may also be used to promote pancreatic amylase producing cells to produce both insulin and amylase. The methods are used to treat diabetes mellitus (type 1) in humans, domesticated animals, livestock and pets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Differentiation of non-insulin producing cells into insulin-producing cells by glucagon-like peptide-1 or extendin-4, used to treat diabetes
                                                                                                                                                                                      Extendin-4, Gila Monster lizard, insulin producing cell; insulin; amylase; diabetes mellitus type 1; human; livestock; pet.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Extendin-4; Gila Monster lizard; insulin producing cell; insulin; amylase; diabetes mellitus type 1; human; livestock; pet.

```
and given in equimolar quantities, is more potent than glucagon-like protein-1 (GLP-1) at causing insulin release from insulin producing cells. GLP-1 is a hormone normally secreted by neuroendocrine cells of the gut, in response to food. GLP-1 fragments or Extendin-4 growth factor fragments can be used in the production of a population of insulin-producing cells from a population of non-insulin producing cells. The methods may also be used to promote pancreatic amylase producing cells to produce both insulin and amylase. The methods are used to treat diabetes mellitus (type 1) in humans, domesticated animals, livestock and pets
                                                                                                                                                                                                                                  This sequence represents an extendin-4 active fragment peptide sequence. Extendin-4 is a peptide produced in the salivary gland of the Gila Monster lizard. Extendin-4 has been shown to promote insulin secretion,
                                                                          Differentiation of non-insulin producing cells into insulin-producing cells by glucagon-like peptide-1 or extendin-4, used to treat diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         February 4, 2005 13:20 Type: P Check: 7453

mellitus.

This sequence represents an extendin-4 active fragment peptide sequence. Extendin-4 is a peptide produced in the salivary gland of the Gila Monster lizard. Extendin-4 has been shown to promote insulin secretion,

Sequence 33 AA;

and given in equimolar quantities, is more potent than glucagon-like protein-1 (GLP-1) at causing insulin release from insulin producing cells. GLP-1 is a hormone normally secreted by neuroendocrine cells of the gut, in response to food. GLP-1 fragments or Extendin-4 growth factor fragments can be used in the production of a population of insulin-producing cells from a population of foon-insulin producing cells. The methods may also be used to promote pancreatic amylase producing cells to produce both insulin and amylase. The methods are used to treat diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents an extendin-4 active fragment peptide sequence. Extendin-4 is a peptide produced in the salivary gland of the Gila Monster lizard. Extendin-4 has been shown to promote insulin secretion, and given in equimolar quantities, is more potent than glucagon-like protein-1 (GLP-1) at causing insulin release from insulin producing cells. ```
This sequence represents an extendin-4 active fragment peptide sequence. Extendin-4 is a peptide produced in the salivary gland of the Gila Monster lizard. Extendin-4 has been shown to promote insulin secretion, and given in equimolar quantities, is more potent than glucagon-like protein-1 (GLP-1) at causing insulin release from insulin producing cells. GLP-1 is a hormone normally secreted by neuroendocrine cells of the gut, in response to food. GLP-1 fragments or Extendin-4 growth factor fragments can be used in the production of a population of insulin-producing cells from a population of non-insulin producing cells. The methods may also be used to promote pancreatic amylase producing cells to produce both insulin and amylase. The methods are used to treat diabetes mellitus (type 1) in humans, domesticated animals, livestock and pets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Differentiation of non-insulin producing cells into insulin-producing cells by glucagon-like peptide-1 or extendin-4, used to treat diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                          Extendin-4; Gila Monster lizard; insulin producing cell; insulin; amylase; diabetes mellitus type 1; human; livestock; pet.

This sequence represents an extendin-4 active fragment peptide sequence. Extendin-4 is a peptide produced in the salivary gland of the Gila monster lizard. Extendin-4 has been shown to promote insulin secretion, and given in equimolar quantilies, is more potent than glucagon-like protein-1 (GLP-1) at causing insulin release from insulin producing cells. GLP-1 is a hormone normally secreted by neuroendocrine cells of the gut, in response to food. GLP-1 fragments or Extendin-4 growth factor fragments can be used in the production of a population of insulinproducing cells from a population of non-insulin producing cells. The methods may also be used to promote pancreatic amylase producing cells to produce both insulin and amylase. The methods are used to treat diabetes mellitus (type 1) in humans, domesticated animals, livestock and pets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Differentiation of non-insulin producing cells into insulin-producing cells by glucagon-like peptide-1 or extendin-4, used to treat diabetes

The present sequence represents an extendin-3 peptide. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. It is used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering praymed or glucagonna. The method is also useful for treating erythema or glucagonoma. The method is also useful for treating diucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Extendin-4; Gila monster lizard; Mexican Beaded lizard; exendin; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.

  This sequence represents an extendin-4 active fragment peptide sequence. Extendin-4 is a peptide produced in the salivary gland of the Gila Monster lizard. Extendin-4 has been shown to promote insulin secretion, and given in equimolar quantities, is more potent than glucagon-like protein-1 (GLP-1) at causing insulin release from insulin producing cells. GLP-1 is a hormone normally secreted by neuroendoorine cells of the gut, in response to food. GLP-1 fragments or Extendin-4 growth factor fragments can be used in the production of a population of insulinmethods may also be used to promote pancreatic amylase producing cells to produce both insulin and amylase. The methods are used to treat diabetes mellitus (type 1) in humans, domesticated animals, livestock and pets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Extendin-3; Gila monster lizard; Mexican Beaded lizard; exendin;

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering plasma glucagon nevel manas, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY94013-43 represent extendin agonists, derived from AAY94012.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Young A,
                                                                                                                                                                                                                                                                                                           diabetes
   The present sequence represents an extendin-4 peptide. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. It is used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering plasma or glucagonem. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Extendin, Gila monster lizard, Mexican Beaded lizard, agonist,

lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic extythems or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating
glucagon levels and/or suppression of glucagon, e.g. type 1 and type diabetes

                                           AAV94013-43 represent extendin agonists, derived from AAV94012. Extendina are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin administering an exendin, an exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering plasma or glucagonnen. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                         Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAY94017 Length: 39 February 4, 2005 13:20 Type: P Check: 9804 Found using 'seq4' (mohamed337.key)

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic extythem are glucagonemia. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY94018 Length: 39 February 4, 2005 13:20 Type: P Check: 9567 Found using 'seq4' (mohamed337.key)

```
AAY94013-43 represent extendin agonists, derived from AAY94012. Extending are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering plasma glucagon levels maked is useful for reating from herrolytic hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                         Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAY94020 Length: 39 February 4, 2005 13:20 Type: P Check: 9563 Found using 'seq4' (mohamed337.key)

 AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering plasma or glucagonna. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagonoma; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma;

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering plasma ar glucagon level in the method is suffering from necrolytic extrhem are glucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin, agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating erythema or glucagonoma. The method is also useful for treating glucagon levels and/or suppression of glucagon, e.g. type I and type 2 diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;
glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma;
hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                       Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.

   8888888888888888888
                                       AAY94013-43 represent extendin agonists, derived from AAV94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating erythema and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type I and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; glucagonoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAY94013-43 represent extendin agonists, derived from AAY94012. are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level, method is useful for lowering plasma glucagonena. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type I and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.

exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level, The method is useful for lowering plasma or glucagonnen. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type I and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;
glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma;
hyperglucagonemia; diabetes.
hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2 diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                               Check: 9724

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for reating from hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type I and type 2
                                                                                                                                                                                                                                                                                                                                                                                           Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plaama glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                               Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;
glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma;
hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY94029 Length: 39 February 4, 2005 13:20 Type: P Check: 9869 Found using 'seq4' (mohamed337.key)

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon levels, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering phasma or glucagonem. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                    Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       P Check: 9430
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           aay94031 ; Amino acid sequence of an extendin agonist.

        AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin gonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering prythema or glucagonema. The method is also useful for treating from necrolytic hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma;
hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                         Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAY94032 Length: 39 February 4, 2005 13:20 Type: P Check: 9476 Found using 'seq4' (mohamed337.key)

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist. a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level, the method is useful for lowering plasma or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Type: P Check: 9546
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    l match found in sequence:
aay94034 ; Amino acid sequence of an extendin agonist.

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level, The method is useful for lowering plasma or glucagonna. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Extendin, Gila monster lizard, Mexican Beaded lizard, agonist, glucagon-like peptide, plasma glucagon, necrolytic erythema, glucagonoma, hyperglucagonemia, diabetes.
                                                                                                                                                                                                                                                         Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAY94035 Length: 39 February 4, 2005 13:20 Type: P Check: 706 Found using 'seq4' (mohamed337.key)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAY94036;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    diabetes
  AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering plasma or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering plasma or glucagonnar. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;
glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma;
hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                              Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAY94037 Length: 39 February 4, 2005 13:20 Type: P Check: 706 Found using 'seq4' (mohamed337.key)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         diabetes
AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist. a modified exendin or amodified exendin gonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering plasma glucagonema. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plaama glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; dlabetes.
                                                                                                                                                                                                                                                                 Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAY94036 Length: 39 February 4, 2005 13:20 Type: P Check: 458 Found using 'seq4' (mohamed337.key)

AMY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level, The method is useful for lowering plasma or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY94039 Length: 39 February 4, 2005 13:20 Type: P Check: 267 Found using 'seq4' (mohamed337.key)

   AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for lowering plasma glucagon level. The method is useful for reating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon, necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                              Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAY94038 Length: 39 February 4, 2005 13:20 Type: P Check: 458 Found using 'seq4' (mohamed337.key)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type I and type 2 diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Extendin, Gila monster lizard, Mexican Beaded lizard, agonist, glucagon-like peptide, plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia, diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAY94040 Length: 39 February 4, 2005 13:20 Type: P Check: 267 Found using 'seq4' (mohamed337.key)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 match found in sequence:
aay94041 ; Amino acid sequence of an extendin agonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (from "seq4ags.pep")

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an agonist, a modified exendin nor a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level method is useful for lowering plasma or glucagonnam. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 glucagon using exendin, an exendin agonist, a modified
lified exendin agonist, useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAY94041 Length: 39 February 4, 2005 13:20 Type: P Check: 706

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     lizard, and have sequence similarity to glucagon-like peptides. They are lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins
                                                                                                                                                                                                                                                                                                                                                                                                                                                Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAY94042 Length: 39 February 4, 2005 13:20 Type: P Check: 458 Found using 'seq4' (mohamed337.key)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         aay94043 ; Amino acid sequence of an extendin agonist.

AAY94013-43 represent extendin agonists, derived from AAY94012. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level, The method is useful for lowering plasma or glucagonna. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Extendin, Gila monster lizard, Mexican Beaded lizard, agonist;
glucagon-like peptide, plasma glucagon, necrolytic erythema; glucagonoma;
hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Length: 39 February 4, 2005 13:20 Type: P Check: 267

The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and Maxican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is susfell for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would type 1 and type 2 diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY94046;
The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                        Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAY94044 Length: 30 February 4, 2005 13:20 Type: P Check: 4889 Found using 'seq4' (mohamed337.key)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Young A,
   The present sequence represents a modified extendin or extendin agonist. Strendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
                                                                                                                                                              Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.

Extending are found in the sallvary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon is subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also benefit from reduced glucagon levels and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;
glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma;
hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     agonist.
                                                                                                                                                                                                                            Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 extendin

                                                                                                                                                                                                                                                                                                                                                                                                     AAY94050;
 The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin or subsetul for lowering plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, useful for lowering plasma or glucagonon. The method is useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.

The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin sponist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is subfering from necrolytic erythema or glucagonna. The method is suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would type 1 and type 2 diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;
glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma;
hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAY94049 Length: 28 February 4, 2005 13:20 Type: P Check: 231

```
The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, useful for merolyric erythema or glucagonoma. The method is useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Extendin, Gila monster lizard, Mexican Beaded lizard, agonist, glucagon-like peptide, plasma glucagon, necrolytic erythema, glucagonoma, hyperglucagonemia, diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a modified extendin or extendin agonist. Strendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, are sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification

The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and bexican Baeded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin or achieved. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans,
describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also beseful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Extendin, Gila monster lizard, Mexican Beaded lizard, agonist;
glucagon-like peptide; plasma glucagon, necrolytic erythema; glucagonoma;
hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                         Type: P Check: 151

The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and hexican Baeded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes. suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2 diabetes Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes. ```
The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon, level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonoma and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.

Sequence 28 AA;

```
The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the dila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolyric erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Extendin; Gila monster lizard; Mexican Beaded lizard; agonist;
glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma;
hyperglucagonemia; diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAY94055 Length: 28 February 4, 2005 13:20 Type: P Check: 107 Found using 'seq4' (mohamed337.key)

                                                                                                                                                                                                                                                                                                                                                                                                                                                       HE STANDARD ```

```
The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering planma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon level, preferably humans, suffering from neorolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
 Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
 Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.

The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
 Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
 Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.

The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin or a suffering agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, useful from mercolytic erythema or glucagonoma. The method is a sloouseful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
 Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g. type 1 and type 2 diabetes
 Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.

The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, useful for necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
 Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
 Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.

The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and Mexican Beaded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin agonist. These compounds lower plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, suffering from necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would

The present sequence represents a modified extendin or extendin agonist. Extendins are found in the salivary glands of the Gila monster and Mexican Baded lizard, and have sequence similarity to glucagon-like peptides. They are used in the method of the invention. The specification describes a method for lowering plasma glucagon, comprising administering an exendin, an exendin agonist, a modified exendin or a modified exendin or a suffering lor lowering plasma glucagon level. The method is useful for lowering plasma glucagon in subjects, preferably humans, useful for necrolytic erythema or glucagonoma. The method is also useful for treating hyperglucagonemia and other conditions that would benefit from reduced glucagon levels and/or suppression of glucagon, e.g.
 Extendin; Gila monster lizard; Mexican Beaded lizard; agonist; glucagon-like peptide; plasma glucagon; necrolytic erythema; glucagonoma; hyperglucagonemia; diabetes.
 Lowering plasma glucagon using exendin, an exendin agonist, a modified exendin or a modified exendin agonist, useful for treating hyperglucagonemia and diabetes.

 molecule
 The invention provides a pharmaceutical composition that comprises a molecule selected from a glucagon-like-peptide-1 (GLP-1) molecule, growth-hormone releasing factor (GRF) molecule or a parathyroid hormone (PTH) molecule. The composition further includes a weak acid such as acetic acid. The pH of the composition is 3 - 5. The composition can be used for the treatment of a disease or condition selected from diabetes, excess appetite, obesity, stroke, ischemia, reperfusion injury, disturbed glucose metabolism, surgery, coma, shock, gastrointestinal disease, diabetes, inver disease, atherosclerosis, vascular disease, Gestational diabetes, liver disease and cirrhosis, glucocraticoid excess, Cushing's disease, the presence of activated counter regulatory hormones that occur after trauma or a disease, hypertriglyceridemia, chronic pancreatitis, the need for parenteral feeding, and a catabolic state following surgery or injury. Sequences ABB0149-15s represent peptide fragments from gila monster venomes that are homologous to GLP-1 molecules and can be included
 GLP-1; glucagon-like-peptide-1; growth-hormone releasing factor; GRF; parachyroid hormone; PTH; antidiabetic; anoretic; exrebroprotective; vasotropic; anti-inflammatcry; antiarteriosclerotic; hepatotropic; tranquilizer; vulnerary; osteopathic; gila monster; exendin.
 New peptide formulation for treating disease e.g. diabetes, obesity, ischemia comprises peptides, an acid having a specified dissociation constant and an excipient.

The invention relates to the treatment of hibernating myocardium by administering a GLP-1 (glucagon like peptide-1) molecule. GLP-1 activity may be described as, cardiant, antidiabetic and vasotropic. GLP-1 may be used for treating, hibernating myocardium, congestive heart failure, ischaemic cardiomyopathy and diabetic cardiomyopathy. GLP-1 reduces plasma or heart norepinepherine level in a patient. The current sequence represents the glucagon like peptide-1 (GLP-1) known as exendin 3

The present invention relates to analogues of glucagon-like peptide-1, comprising glucagon-like peptide-1 (GLP-1) modified with a reactive group that reacts with a thiol group on a blood component to form a covalent bond, where the reactive group is chosen from an activated disulfide bond group or an S-sulfonate. The analogues are useful for manufacturing madicament and treating non-insulin dependent disubtes, obssity, stroke, myocardial infraction, stress induced hyperglycaemia or irritable bowel syndrome. The present sequence is a peptide shown in the exemplification
 Novel glucagon-like peptide-1 compound comprising glucagon-like peptide-1 modified with reactive group that reacts with thiol group on blood component to form covalent bond, useful for treating obesity, stroke.
 Glucagon-like peptide-1; analogue; GLP-1; antidiabetic; anorectic;

The invention relates to novel analogues of exendin-4 (ABP58572-ABP58576) or their pharmaceutically acceptable salts. The invention also encompasses a procedure for preparing the exendin-4 analogues. Exendin-4 (ABP58578) is a polypeptide obtained from the Mexican beaded lizard (Heloderma horridum) which acts as an agonist of glucagon-like peptide 1 (GLP-1, see ABP58577). Like exendin-4 the facelf, the exendin-4 analogues of the invention have antidiabetic activity, being able to promote the secretion of insulin and reduce blood sugar, and are thus applicable in treating type 2 diabetes. Oll micrograms of an exendin-4 analogue was common value after one hour, and its effects lasted 30 minutes longer than 4 micrograms of insulin. The exendin-4 analogues of the invention can be synthesised either chemically or by recombinant methods, thereby permitting large-scale production. The present sequence represents wild.
 Polypeptide exendin-4 derivatives, useful for promoting insulin secretion and reducing blood sugar, for treating diabetes type 2.

New Glucagon-like peptide-1 or exendin-2 polypeptides, or their analogues, useful for treating a subject with diabetes or a neurodegenerative condition (e.g. Alzheimer's disease, stroke, multiple sclerosis or brain injury).

Example 2; Fig 1; 119pp; English.

The invention relates to a purified polypeptide, which comprises the amino acid sequence of Glucagon-like peptide-1 (GLP-1), a GLP-1 analogue. Exendin-4 or an exendin analogue with a spacer between the amino acid residues comparable to residues 7 and 8. or residues 8 and 9 of GLP-1.

Also include are: (1) reducing neuronal death, promoting neuronal differentiation or proliferation, or promoting growth of neuronal processes, by contacting one or more neurons with the polypeptide; and c2) reducing formation or accumulation of amyloid protein by contacting one or more neurons with the polypeptide, which affects amyloid precursor protein metabolism. The polypeptides which affects amyloid precursor protein metabolism. The polypeptides are useful for treating subject with diabetes (particularly type 2 diabetes) or a neurodegenerative condition (e.g. Alzheimer's disease, Parkinson's disease, Huntington's disease, amycrorophic aleral sclerosis, stroke, multiple sclerosis, brain injury, spinal chord injury or peripheral neuropathy), as well as for reducing the symptom(s) of neurodegenerative conditions in a subject. The polypeptides are also useful for treating a subject with neurotoxic injury or neurodegenerative condition in a subject. The polypeptides are also useful for treating a subject in a subject in neurotoxic injury or neurodegenerative condition in a subject. The persent sequence is a Gila-monster lizard exendin-4 analogue

The present invention relates to an adenoviral vector comprising a polymucleotide sequence encoding glucagon-like peptide 1 (GLP-1) or glucose-dependent insulinotropic peptide (GIP), a polymucleotide sequence encoding a signal sequence upstream of it, and a polymuclation signal downstream of it. The viral vector is useful in gene therapy for treating type II diabetes, obesity and related conditions by in vivo expression of GLP-1, and/or GIP. The treatment may be combined with the administration of dipeptidyl peptidase IV (DPP-IV) inhibitors. ABU91969-ABU91975 represent GLP-1, GLP-1 variant, exendin or GIP peptides
 New viral vectors comprising a sequence encoding glucagons-like peptide 1 or glucose-dependent insulinotropic peptide, a sequence encoding a signal sequence, and a polyadenylation signal, for treating e.g. diabetes or

The ivention describes a method for the treatment or prevention of intermittent claudication or skeletal muscle injury caused by ischaemia and/or reperfusion in a human subject, comprising the administration of a glucagon-like peptide-1 (GLP-1) molecule. The method is useful for treating or preventing intermittent claudication or skeletal muscle suffering from peripheral vascular disease (PVD). Administration of GLP-1 in a subject improves skeletal muscle performance by promoting glucose oxidation and reducing fatty acid oxidation. This is the amino acid sequence of a mammalian glucagon-like peptide-1 peptide GLP-1(1-37) that can be used in the method of the invention.
 Method for the treatment or prevention of intermittent claudication or skeletal muscle injury caused by ischemia and/or reperfusion in a human subject, comprises administration of a glucagon-like peptide-1 molecule.

The present invention describes derivatives (A1) of GLP-1 (glucagon-like peptide-1) (7-c) (with c = 35 or 36) having just one lipophilic computations (LS) attended to the C-terminal amino acid (aa) and derivatives (A2) of exendin with LS attended to at least one as of the parent peptide. Al excludes compounds Arg26, Arg34, Lys36-(N-computation) and A2 blus compounds Arg26, Arg34, Lys36-(N-computation) and A2 plus a vehicle or carrier. Al and A2 have containing A1 and A2 plus a vehicle or carrier. Al and A2 have containing A1 and A2 plus a vehicle or carrier. Al and A2 have also inhibit gastric emptying and pancreatic secretion and may reduce containing and obesity, and also to prevent hyperglycaemic activities. Al stimulates secretion of insulin but suppresses that of glucagon. They also inhibit gastric emptying and pancreatic secretion and may reduce food intake. Al and A2 are used to treat (non-)insulin-dependent diabetes mellitus and obesity, and also to prevent hyperglycaemia. Al and A2 have a greater persistence in vivo than corresponding peptides without LS (because of reduced sensitivity to dipeptidyl peptidases). When formulated with other antidiabetic agents, they often produce a synergistic effect. The present sequence represents an exendin derivative function of the present
 New derivatives of glucagon-like peptide-1 and exendin containing
lipophilic substituent, for treating diabetes and obesity.

This invention describes a novel method for discovering a substance that is pharmaceutically active in a target organism. The method comprises generating an BST (expressed sequence tag) library from the reference organism or tissue and identifying active compounds in the reference organism or tissue and identifying active compounds in the reference organisms or tissue and identifying active comparison between the BST (library and sequence information on the target organism. Particularly at least two reference organisms are used, to allow identification of conserved structures, which are then used to identify orthologous structures are then condition, e.g. by structure-based optimisation of the required or properties. The method is used to identify polypeptides which are then used optionally after optimisation of properties, as pharmaceuticals, or after validation as a drug target, for development of ligands, also potential pharmaceuticals. Polypeptides and nucleic acids encoding them, can also be used for identification and validation of drug targets and for identification and validation of drug targets and active interest at structures for pharmaceutical development. The method facilitates discovery of agents that are biologically active, specifically in humans, and should reduce the time between discovery and development of new drugs, since previous understanding of molecular mechanisms of pathology or of the structures involved in drug design are not necessary. The identified drugs will usually be very specific, with reduced side effects. Sequencing of a cDNA bank from the mexican bearded itzard peptide. This invention relates to a novel method for the prevention and intervention into Type I diabetes and Latent Autoimmune Diabetes in the Adult (LADA). Specifically, it refers to the administration of a modulator derived from a CD3 and GLP-1 compound. This combined treatment provides a synergistic effect and can attenuate the further destruction of beta-cells, hence improving glycaemic control in diabetic patients. Furthermore, it can be used as a prophylactic for people at high risk for the development of type I diabetes and can provide an improved prognosis with respect to microvascular and macrovascular complications. The present invention describes exendin, a GLP-1 compound that is insulinotropic, as well as analogues and fragments derived thereof that can be used to modulate beta cell function. Accordingly, the compositions of this invention exhibit immunosuppressive and antidiabetic activities. This peptide sequence is a GLP-1 compound, the exendin peptide of the

This invention relates to a novel method for the treatment or prevention of an early cardiac or early cardiovascular disease in a diabetic or non-diabetic patient where a glucagon like peptide—1 (GLD 1) agonist or its salt is used. The invention may be useful for the development of antianginal, antiarteriosclerotic, vasotropic or hypotensive activity compounds with a cardiant, cardiovascular-Gen, antiarrhythmic, antiarteriosclerotic, vasotropic or hypotensive activity compounds with a cardiant, cardiovascular-Gen, antiarrhythmic, antiantiar antianginal may be used for the treatment or prevention of an early cardiac or early cardiovascular disease, essential cardiac drawnical ar hypertensive emergency, cardiovascular disease, essential hypertension, acute hypertensive emergency, cardiomyopathy, heart cardiac dysthythmia, syncopy, acherosclerosis, mild chronic heart failure, antihmia, somethy, exercise tolerance, chronic heart failure, arrhythmia, cardiac dysthythmia, syncopy, acherosclerosis, mild chronic heart failure, angina pectoris, cardiac bypass reocclusion, intermittent claudication (for example atherosclerosis, mild chronic heart failure, cardiaction of a pharmaceutical composition for reducing the level of brain natriuretic peptide (BNP) in plasma and/or heart tissue in a diabetic or non-diabetic patient. The invention may also be useful for the treatment of myocardial infarction, acute coronary cardiac and morbidity after stroke. The diabetic patient or non-diabetic patient in the form of the coronary corresponding to prove the coronary coronary cardiact or non-diabetic patient. The invention may also be syndrome, unstable angina, non-Q-wave cardiac necrosis, Q-wave myocardial the corresponding of a pharmaceutical propriet or non-diabetic patient. the corresponding other GLP-1 analogues. The GLP-1 analogues lower the brain natriuretic peptide (BNP) in the plasma and/or heart tissue, in addition to lowering blood glucose and plasma lipids. The present sequence is that of an exendin peptide which is related to the invention.

New peptide conjugates used for treating, e.g. pain, HIV, depression, schizophrenia, osteoporosis or insomnia.

Claim 24; Page 91; 113pp; English

```
The invention relates to a novel pharmacologically active peptide conjugate having a reduced tendency towards enzymatic cleavage comprises X and Z, where: (a) X is a pharmacologically active peptide sequence; and (b) Z is a stabilising peptide sequence of 4-20 amino acid units covalently bound to X, where each amino acid unit in the stabilizing peptide sequence. Z being selected from Ala, Leu, Ser, Thr, Tyr, Asr, Gln, Asp, Glu, Lys, Arg, His, Met, Orn, and amino acid units of formula NH-C(R1)(R2)-C(-O)-(1), where R and R2 are H, 1-6c alkyl, phenyl, phenyl, where 1-6c-alkyl is optionally substituted with 1-3 substituted with 1-3 substituents selected from halogen, hydroxy, amino, cyano, nitro, substituted with 1-3 substituents selected from 1-6c-alkyl, 2-6c-alkenyl,
pharmacologically active peptide conjugate is not selected from sequences (ADI24837)-(ADI24841). The peptide conjugates can be used for treating e.g. pain, HIV, cancer, diabetes, incontinence, hypertension, amnesia, Alzheimer's disease, fever, depression, sex hormone regulation, eating disorders, schizophrenia, osteoporosis or insomnia. They can also be used for treating e.g. CNS disorders and as contraceptives. The conjugated peptides are less susceptible to degradation by proteases compared to the corresponding free pharmacologically active peptides. This sequence represents a pharmacologically active peptide as the X part of the peptide of the invention.
 adi24855 ; Exendin-3 as active moiety for pharmacologically active peptide.

 Young AA,
 The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
 Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.

Disclosure; SEQ ID NO 24; 173pp; English.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25\$ of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity. hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.

```
The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyalipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
 Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25 of the predetermined release period. The composition has antidiabetic, of the predetermined release period. The novel composition and method anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
 Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml. is achieved for at least 25¢ of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity,
 ģ
 anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperglycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
 Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
predetermined release period. The composition has antidiabetic,

The invention relates to a novel pharmaceutical composition comprising an exemdin (agonist) peptide in an extended release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25 of the predetermined release period. The composition has antidiabetic, anorectic, and antilippemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by the control of the period of the predetermined release period.

The invention relates to a novel pharmaceutical composition comprising an exendin (agonist) peptide in an extended-release formulation. The formulation is capable of releasing the peptide over a predetermined release period, the period being at least one hour, and in an amount such that, when the composition is administered to a human, an average sustained plasma level of at least 5 pg/ml is achieved for at least 25% of the predetermined release period. The composition has antidiabetic, anorectic, and antilipaemic activities. The novel composition and method are useful in treating diabetes and conditions that would be benefited by lowering plasma glucose or delaying and/or slowing gastric emptying or inhibiting food intake, such as impaired glucose tolerance, obesity, hyperelycaemia, dyslipidaemia or cardiovascular disease. This sequence represents an exendin agonist peptide of the invention.
 Pharmaceutical composition for treating diabetes, impaired glucose tolerance, obesity, dyslipidemia or cardiovascular disease comprises an exendin or an exendin agonist peptide in an extended-release formulation.
 exendin; extended-release formulation; plasma level; antidiabetic; antilipaemic; diabetes; glucose; gastric emptying; inhibiting food intake; tolerance; obesity; hyperglycaemia; dyslipidaemia; cardiovascular.

Novel glucagon-like peptide-1 receptor agonist or modified GLP-1 receptor agonist, useful for treating diabetes, impaired glucose tolerance, metabolic syndrome or pre-diabetic state.

Example 1; SEQ ID NO 3; 56pp; English.

The present sequence is that of extendin 4, an example of a glucagon-like peptide 1 (GLP-1) receptor agonist. Modified GLP-1 receptor agonists of the invention comprise a GLP-1 receptor agonist such as the present peptide linked to a polyethylene glycol polymer having a molecular weight of greater than 30 kDa. The modified GLP-1 receptor agonists are useful for treating type 1 diabetes, type 2 diabetes, maturity onset diabetes of the young, latent autoimmune diabetes adult, gestational diabetes and Syndrome X (all claimed). They can also be used to treat hyperglycaemia, impaired glucose tolerance, impaired fasting glucose and obesity caused by inducing glucose-dependent insulin secretion. They may also be effective in the treatment of obesity, atherosclerotic disease, hyperlipideemia, hypertholesterolaemia, low high density lipoprotein levels, hypertension, cardiovascular disease (including atherosclerosis, coronary heart disease and hypertension), cerebrovascular disease,

Purifying fermentation-derived product such as interleukins, insulin, albumin, involves microfiltration of fermentation broth containing fermentation-derived product at specific microfiltration temperature and isolating final product

Claim 25; Page 17; 20pp; English.

This invention relates to a novel method of purifying a fermentation-derived product, which involves microfiltration of a fermentation broth containing the fermentation-derived product at a microfiltration temperature within the range from 66-90 degrees C and isolating the final product. The method of the invention is efficient in purifying a fermentation-derived product with an improved microfiltration process comprising elevated temperatures. The present sequence is that of an exendin-4 analogue ZP10 peptide which is a fermentation-derived product to which the method of the invention may be applied.

This invention relates to a novel method of preventing and/or delaying diabetes in a subject in need, which involves administering to the subject an effective amount of a compound that increases beta-cell proliferation and/or reduces beta-cell apoptosis in the subject. The invention may be useful for the production of compounds with an antidiabetic or immunosuppressive activity by increasing expression of protein kinase (Aktl and/or p44MAPK) in the beta-cells and decreasing caspase-3 activation. The method is useful for preventing and/or delaying diabetes in a subject. The present sequence is that of a human exendin-4 peptide which is related to the method of the invention.

The invention relates to a novel method for treating a subject suffering from polycystic ovary syndrome (PCOS). The method comprises administering a compound consisting of sendin, or its agonists or nanloques, having a compound consisting of sendin, or its agonists or nanloques, having a capeunce given in the specification, where the subject exhibits at least one symptom of PCOS. The invention further relates to: reducing insulin resistance in a subject suffering from PCOS; preventing the onset of type 2 diabetes in a subject suffering from PCOS; restoring regular ovalation in a subject suffering from PCOS is preventing spontaneous abortion in a subject suffering from PCOS. The nethod is useful in treating a subject suffering from PCOS. The novel compounds of the invention may be used in gene therapy to treat PCOS. The method is useful in treating a subject suffering from provel compounds of the invention may be used in gene therapy to treat polygatic ovary syndrome (PCOS) for reducing insulin resistance, restoring regular ovalation and fertility or preventing spontaneous provel control in a subject. Use of an incertin, a glucagon-like peptide-1, an exendin, or a compound that binds to a receptor for glucagon-like peptide-1 in the treatment of cardiac arrhythmias by metabolic intervention.

Disclosure; SEQ ID NO 12; 49pp; English.

The present sequence is that of the exendin-3 peptide of Heloderma harridum. This is a glucose-dependent insulinotropic peptide that

glucose-dependent insulinotropic peptide that enhances peripheral

```
computes peripheral glucose uptake without inducing dangerous hyperglycaemia. The present invention provides methods and compositions cor for preventing and treating cardiac arrhythmias. The compositions computes exendin, GLP-1, an incretin, a compound that binds to a receptor for GLP-1, or an agonist, analogue, derivative or variant of these compounds or their biologically active fragments. These compounds enhance peripheral glucose uptake by potentiating insulin secretion without inducing dangerous hypoglycaemia. They are effective at maintaining the electrochemical gradient across cardiac cellular membranes, thereby reducing the likelihood of arrhythmias developing. They also strongly suppress glucagon secretion, independent of its insulinotropic action, and thereby reduce plasma free fatty acid (FFA) levels substantially more than can be accomplished with insulin. High FFA levels been implicated as a major toxic mechanism during myocardial ischaemia. The compounds can be administered by injection following an ischaemic event or a cardiac intervention such as angioplasty, coronary bypass grafting or placement of an intracoronary stent, and can be used to treat or prevent ventricular arrhythmias such as cardiac ischaemia, cardiac ischaemia, cardiac ischaemia, cardiac ischaemia, cardiac ischaemia, cardiac

The present sequence is that of 14Leu, 22Ala, 25Phe exendin-4 (1-28) amide derived from Heloderma suspectum exendin.4 ADQ28643. It is an example of exendin analogues of the invention. The present invention provides methods and compositions for preventing and treating cardiac arrhythmias. The compositions compromed preventing and treating cardiac arrhythmias. The compositions comprounds or their biologically active fragments. These compounds or their biologically active fragments. These compounds enhance peripheral glucose uptake by potentiating insulin compounds enhance peripheral glucose uptake by potentiating insulin secretion without inducing dangerous hypoglycaemia. They are effective at menhanes, thereby reducing the likelihood of arrhythmias developing. They also strongly suppress glucagon secretion, independent of its insulinotropic action, and thereby reduce plasma free fatty acid (FPA) levels have been implicated as a major toxic mechanism during myocardial ischaemia. The compounds can be adcomplished with insulin. High FFA levels have been implicated as a major toxic mechanism during myocardial ischaemia. The compounds can be administered by injection following an ischaemic event or a cardiac intervention such as angioplasty, coronary bypass grafting or placement of an intracoronary stent, and can be, used to treat or prevent venticular arrhythmias such as angioplasty. Use of an incertin, a glucagon-like peptide-1, an exendin, or a compound that binds to a receptor for glucagon-like peptide-1 in the treatment of cardiac arrhythmias by metabolic intervention. cardiac ischaemia-reperfusion and congestive heart failure Disclosure; SEQ ID NO 24; 49pp; English Hathaway DR, Baron AD; WPI; 2004-507584/48.

 This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake

This invention describes a novel formulation (1) comprising an exendin or exendin agonist peptide, a buffer and an iso-Genolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the ensativity of a subject to insulin to treat diabetes and disorders would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
 Exendin; agoniet; treatment; antidiabetic; insulin sensitivity; diabetes; plasma glucose; gastric emptying; food intake.
 New formulations comprising an exendin or exendin agonist peptide used for increasing the sensitivity of a subject to insulin to treat diabetes.

This invention describes a novel formulation (1) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the ensistivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying

This invention describes a novel formulation (1) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake
 This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7.  This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying or reducing food intake

This invention describes a novel formulation (I) comprising an exendin or exendin agonist peptide, a buffer and an iso-osmolality modifier which has a pH of 3-7. The products of the invention have antidiabetic activity. The exendin or exendin agonist is used to increase the sensitivity of a subject to insulin to treat diabetes and disorders which would benefit from agents which lower plasma glucose levels and disorders which would benefit from agents that delay and/or slow gastric emptying
